QUANTUM SECURITY INTELLIGENCE

Security & Post-Quantum Readiness Audit Report

besu @ 1f1ebc2573e1 · Hyperledger Besu — public repository (passive review)

Organization	QSI
Report date	2026-11-06 15:36 UTC
Report version	1
Audit run	9e414b52-3a81-4bd6-96a2-eeef0fccce6f · Document audit · 2026-11-06 15:36 UTC
Analyzer engine	qsi-engine 1.3.0
Risk profile	Crypto exchange, custodian or wallet
Content SHA-256	`25c60fc9a59edc6c0ea69ca2871ea1967c583c30f639e09b309380192ecf324d`
Signature key (Ed25519, SHA-256 fingerprint; the signature is the separate file report.sig.json)	`5b3cf9c9bd0fa54447e2b5dfa7a6bab569bd0c666fa46949599e5c348d17083e`

Contents

1. Executive summary
2. Scope and boundaries
3. Methodology
4. Assets examined and not examined
5. Architecture overview
6. Overall security posture
7. Findings by severity
8. Detailed findings
9. Evidence
10. Post-quantum assessment
11. Limitations and assumptions
12. Remediation plan
13. Priorities for 30, 60 and 90 days
14. Verification after remediation
15. Tools used
16. Sources and normative documents
17. Appendices

This report presents automated and documented analysis results for the stated scope. It is not a legal opinion, a certification or an attestation of compliance with any standard.

Executive summary

7	0	0	7	0
Findings in total	Critical	High	Medium	Low

Classification	Count
Confirmed technical vulnerability	0
Known vulnerable component	0
Confirmed configuration error	0
Potential cryptographic risk	0
Long-term post-quantum risk	7
Improvement recommendation	0
Insufficient data	0

Top 5

ID	Severity	Detailed findings	Priority score
QSI-2026-19546	Medium	Quantum-vulnerable ECDH: key wrapping and data encryption at rest (1 file(s)) preliminary	36.9
QSI-2026-19543	Medium	Quantum-vulnerable ECDSA: transaction and message signing (6 file(s)) preliminary	35.6
QSI-2026-19544	Medium	Quantum-vulnerable BLS12-381: transaction and message signing (11 file(s)) preliminary	35.6
QSI-2026-19545	Medium	Quantum-vulnerable RSA: transaction and message signing (1 file(s)) preliminary	35.6
QSI-2026-19540	Medium	Quantum-vulnerable ECDSA: role not determined (11 file(s)) preliminary	34.2

Mosca's inequality (x + y > z): x = 10, y = 5, z = 8 → migration would finish too late under this scenario. z is a planning assumption chosen per risk profile, not a prediction. A cryptographically relevant quantum computer is not publicly known to exist today.

Post-quantum maturity: Level 0 of 4 — no post-quantum cryptography. Next step: Inventory where classical public-key cryptography protects long-lived data and keys, and choose the first migration: usually a hybrid TLS key exchange and wrapped keys.

Scope and boundaries

Mode: Document audit

Repository: https://github.com/besu-eth/besu @ 1f1ebc2573e187a1339887fbc2a859f095029f21 — evidence links open the lines at this commit.

Supplied inputs

2927 files, 14494630 bytes in total, 1 redaction(s); the per-file SHA-256 list is in appendix C.

Methodology

The audit was performed by the QSI engine 1.3.0. Each analyzer emits facts (rule, parameters, evidence); finding texts are generated from the rule catalog. Methodology sources are listed under "Sources and normative documents".

Prioritization uses an explainable weighted model (severity, exploitability, exposure, confidentiality/integrity/availability impact weighted by the "Crypto exchange, custodian or wallet" profile, asset criticality, urgency, ease of remediation) with a confidence multiplier. CVSS v3.1 is applied only to technical vulnerabilities with a defined vector. Long-term quantum risks use Mosca's inequality; their severity is capped at Medium and they are never presented as exploitable vulnerabilities.

Finding classes: confirmed technical vulnerability; known vulnerable component (a dependency version named in an advisory; whether the affected code is reachable is assessed separately, and a component confirmed by review becomes a vulnerability); confirmed configuration error; potential cryptographic risk; long-term post-quantum risk; improvement recommendation; insufficient data. Heuristic findings are marked preliminary; analyst decisions are shown next to the findings.

Coverage of checks

Area	Status	Count	Examples
source_code	checked	2927	.github/scripts/verifyArtifacts.py: 55 lines scanned with 16 rule patterns and 267 registry patterns; app/build.gradle: 121 lines scanned with 16 rule patterns and 267 registry patterns; app/src/main/java/org/hyperledger/besu/Besu.java: 108 lines scanned with 16 rule patterns and 267 registry patterns
secrets	checked	1	ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/DefaultAuthenticationService.java: 1 redacted value(s) not reported (comments, test modules, fixture declarations, placeholders, values the source annotates as published, or hex values not bound to a secret name)
keys	error (not checked)	1	ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/JWTAuthOptionsFactory.java line 118: public key could not be parsed (ValueError)
certificates_and_keys	checked	1	ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/JWTAuthOptionsFactory.java: certificates/keys parsed
entropy	checked	1	random-number generation: 2867 code files read with 0 macro definitions from the tree; 0 ineffective guard(s), 0 weak random-bytes provider(s), 0 weak key-generation site(s)

Long lists are grouped here; the full per-file list is in the JSON report, signed with the same key.

Assets examined and not examined

Supplied inputs: 2928 (input files: C)

Not checked

- keys: ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/JWTAuthOptionsFactory.java line 118: public key could not be parsed (ValueError)

Architecture overview

Static review of the source tree besu at 1f1ebc2573e187a1339887fbc2a859f095029f21. 2927 files analysed; of 58293 files, 55251 are test, fuzzing, benchmark or example code and were left out, 115 are not read by any analyzer, 0 exceed the per-file limit and 0 did not fit the total limit. Files no analyzer reads include: .dockerignore, .gitattributes, .github/CODEOWNERS, .github/ISSUE_TEMPLATE/bug-report.md, .github/ISSUE_TEMPLATE/contributor-call.md. 100 files in build-output or dependency-cache directories (.git, .hg, .venv, __pycache__, build, dist, node_modules, target, vendor, venv) were not read. No requests were sent to the owner's systems.

Overall security posture

100
Indicative posture index (0–100)

54.5%
Quantum-vulnerable share of inventory

77
Cryptographic inventory

Derived from findings in scope (confirmed and potential issues weighted by severity). Indicative only; not comparable across differently scoped audits.

Findings by severity

ID	Detailed findings	Classification	Severity	Confidence
QSI-2026-19546	Quantum-vulnerable ECDH: key wrapping and data encryption at rest (1 file(s))	Long-term post-quantum risk	Medium	Medium, preliminary
QSI-2026-19543	Quantum-vulnerable ECDSA: transaction and message signing (6 file(s))	Long-term post-quantum risk	Medium	Medium, preliminary
QSI-2026-19544	Quantum-vulnerable BLS12-381: transaction and message signing (11 file(s))	Long-term post-quantum risk	Medium	Medium, preliminary
QSI-2026-19545	Quantum-vulnerable RSA: transaction and message signing (1 file(s))	Long-term post-quantum risk	Medium	Medium, preliminary
QSI-2026-19540	Quantum-vulnerable ECDSA: role not determined (11 file(s))	Long-term post-quantum risk	Medium	Medium, preliminary
QSI-2026-19541	Quantum-vulnerable BN254 (alt_bn128): role not determined (1 file(s))	Long-term post-quantum risk	Medium	Medium, preliminary
QSI-2026-19542	Quantum-vulnerable ECDH: role not determined (4 file(s))	Long-term post-quantum risk	Medium	Medium, preliminary

Detailed findings

QSI-2026-19546 · CODE-QV-ASYMMETRIC

Medium

Quantum-vulnerable ECDH: key wrapping and data encryption at rest (1 file(s))

Long-term post-quantum risk | Confidence: Medium | preliminary — requires further verification

3 reference(s) to ECDH across 1 file(s), e.g. ethereum/p2p/src/main/java/org/hyperledger/besu/ethereum/p2p/rlpx/handshake/ecies/ECIESHandshaker.java:174. Role, judged from paths, function names and nearby code: key wrapping and data encryption at rest. Keys or data encrypted to these public keys are stored: anyone who copies them now decrypts them once a CRQC exists (harvest now, decrypt later).

Affected asset	source-code:ECDH:key_wrapping
Data source	ethereum/p2p/src/main/java/org/hyperledger/besu/ethereum/p2p/rlpx/handshake/ecies/ECIESHandshaker.java
Detection method	Regular-expression matching of crypto API patterns; the role comes from words in paths, enclosing function names and the lines around the matches.
Analyzer	source_code 1.3.0 · 2026-11-06 15:36 UTC
Priority score	36.9 / 100 (Crypto exchange, custodian or wallet)
CVSS v3.1	not applicable
Mosca's inequality (x + y > z)	x=10.0, y=5.0, z=8.0 → migration would finish too late under this scenario

POTENTIAL IMPACT

Long-term risk depends on what the algorithm protects: signatures (authenticity until migration) or key exchange/encryption (retroactive decryption of recorded data).

REPRODUCTION STEPS

```
Open ethereum/p2p/src/main/java/org/hyperledger/besu/ethereum/p2p/rlpx/handshake/ecies/
ECIESHandshaker.java:174 and inspect the quoted lines; the evidence lists further files.
```

EVIDENCE

```
255 |       throw new HandshakeException(
256 |           "Unable to create ECDH Key agreement due to Crypto engine failure", e);
257 |     }
```

LIMITATIONS OF THE CHECK

This is a forward-looking risk that depends on the arrival of a cryptographically relevant quantum computer (CRQC). No such computer is publicly known to exist today; the timeline is uncertain. It is not a present-day exploitable vulnerability. Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

RECOMMENDATION

Wrap keys with ML-KEM or a hybrid KEM (X25519 + ML-KEM-768) and re-wrap the stored keys; data that may already have been copied needs its own assessment.

RETEST PROCEDURE

Re-run the inventory after refactoring.

P. W. Shor — Polynomial-Time Algorithms for Prime Factorization and Discrete Logarithms on a Quantum Computer (SIAM J. Comput., 1997); NIST IR 8547 — Transition to Post-Quantum Cryptography Standards; M. Mosca — Cybersecurity in an Era with Quantum Computers: Will We Be Ready? (IEEE Security & Privacy, 2018)

QSI-2026-19543 · CODE-QV-ASYMMETRIC

Medium

Quantum-vulnerable ECDSA: transaction and message signing (6 file(s))

Long-term post-quantum risk | Confidence: Medium | preliminary — requires further verification

22 reference(s) to ECDSA across 6 file(s), e.g. crypto/algorithms/src/main/java/org/hyperledger/besu/crypto/SECP256K1.java:18. Role, judged from paths, function names and nearby code: transaction and message signing. A CRQC derives the private key from a public key that is already known (on chain after the first spend, in reused addresses): funds and approvals controlled by these keys need a migration path.

Affected asset	source-code:ECDSA:transaction_signing
Data source	crypto/algorithms/src/main/java/org/hyperledger/besu/crypto/SECP256K1.java
Detection method	Regular-expression matching of crypto API patterns; the role comes from words in paths, enclosing function names and the lines around the matches.
Analyzer	source_code 1.3.0 · 2026-11-06 15:36 UTC
Priority score	35.6 / 100 (Crypto exchange, custodian or wallet)
CVSS v3.1	not applicable
Mosca's inequality (x + y > z)	x=10.0, y=5.0, z=8.0 → migration would finish too late under this scenario

POTENTIAL IMPACT

Long-term risk depends on what the algorithm protects: signatures (authenticity until migration) or key exchange/encryption (retroactive decryption of recorded data).

LIMITATIONS OF THE CHECK

This is a forward-looking risk that depends on the arrival of a cryptographically relevant quantum computer (CRQC). No such computer is publicly known to exist today; the timeline is uncertain. It is not a present-day exploitable vulnerability. Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

RECOMMENDATION

Follow each chain's post-quantum roadmap, avoid public-key reuse, and keep signers ready to add post-quantum signature schemes as chains adopt them.

RETEST PROCEDURE

Re-run the inventory after refactoring.

LIMITATIONS OF THE CHECK

This is a forward-looking risk that depends on the arrival of a cryptographically relevant quantum computer (CRQC). No such computer is publicly known to exist today; the timeline is uncertain. It is not a present-day exploitable vulnerability. Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

RECOMMENDATION

Follow each chain's post-quantum roadmap, avoid public-key reuse, and keep signers ready to add post-quantum signature schemes as chains adopt them.

RETEST PROCEDURE

Re-run the inventory after refactoring.

P. W. Shor — Polynomial-Time Algorithms for Prime Factorization and Discrete Logarithms on a Quantum Computer (SIAM J. Comput., 1997); NIST IR 8547 — Transition to Post-Quantum Cryptography Standards; M. Mosca — Cybersecurity in an Era with Quantum Computers: Will We Be Ready? (IEEE Security & Privacy, 2018)

QSI-2026-19545 · CODE-QV-ASYMMETRIC

Medium

Quantum-vulnerable RSA: transaction and message signing (1 file(s))

Long-term post-quantum risk | Confidence: Medium | preliminary — requires further verification

1 reference(s) to RSA across 1 file(s), e.g. ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/JWTAuthOptionsFactory.java:107. Role, judged from paths, function names and nearby code: transaction and message signing. A CRQC derives the private key from a public key that is already known (on chain after the first spend, in reused addresses): funds and approvals controlled by these keys need a migration path.

Affected asset	source-code:RSA:transaction_signing
Data source	ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/JWTAuthOptionsFactory.java
Detection method	Regular-expression matching of crypto API patterns; the role comes from words in paths, enclosing function names and the lines around the matches.
Analyzer	source_code 1.3.0 · 2026-11-06 15:36 UTC
Priority score	35.6 / 100 (Crypto exchange, custodian or wallet)
CVSS v3.1	not applicable
Mosca's inequality (x + y > z)	x=10.0, y=5.0, z=8.0 → migration would finish too late under this scenario

POTENTIAL IMPACT

Long-term risk depends on what the algorithm protects: signatures (authenticity until migration) or key exchange/encryption (retroactive decryption of recorded data).

REPRODUCTION STEPS

```
Open ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/
JWTAuthOptionsFactory.java:107 and inspect the quoted lines; the evidence lists further files.
```

EVIDENCE

Post-quantum assessment

	Key establishment (x = how long data must stay confidential; harvest now, decrypt later)	Signatures (x = how long signatures/ keys must stay trusted)
Data/key lifetime x	10	10
Migration time y	5	5
Assumed years to CRQC z	8 (early)	8
x + y − z	7 → migration would finish too late under this scenario	7 → migration would finish too late under this scenario

Planning assumptions: x for key establishment, x for signatures, y are the defaults of the risk profile “Crypto exchange, custodian or wallet”, not the client's figures; with the client's actual lifetimes the verdict can change.

Post-quantum maturity: Level 0 of 4 — no post-quantum cryptography

- Classical only — key wrapping and data encryption at rest: ECDH (1 file(s))

Next step: Inventory where classical public-key cryptography protects long-lived data and keys, and choose the first migration: usually a hybrid TLS key exchange and wrapped keys.

Levels: 0 none; 1 present, not wired; 2 in use outside the critical paths; 3 hybrid in a critical path; 4 post-quantum by default in the critical paths (root of trust, key wrapping, channel key exchange). Judged from code and manifests.

What the quantum-vulnerable algorithms do

Role	Algorithms (files)	ID	First step
key wrapping and data encryption at rest	ECDH (1)	QSI-2026-19546	Wrap keys with ML-KEM or a hybrid KEM (X25519 + ML-KEM-768) and re-wrap the stored keys; data that may already have been copied needs its own assessment
transaction and message signing	BLS12-381 (11), ECDSA (6), RSA (1)	QSI-2026-19543, QSI-2026-19544, QSI-2026-19545	Follow each chain's post-quantum roadmap, avoid public-key reuse, and keep signers ready to add post-quantum signature schemes as chains adopt them
role not determined	ECDSA (11), ECDH (4), BN254 (alt_bn128) (1)	QSI-2026-19540, QSI-2026-19541, QSI-2026-19542	Classify each usage, record data lifetimes, and plan migration to ML-DSA (FIPS 204) or SLH-DSA (FIPS 205), in a hybrid/composite form where the ecosystem supports it; introduce an abstraction layer for crypto-agility

Roles are judged from file paths, function names and the code around each match; review confirms them. Root-of-trust keys and wrapped keys come first: they are hard to replace or can be recorded today.

z is a planning assumption chosen per risk profile, not a prediction. A cryptographically relevant quantum computer is not publicly known to exist today.

Quantum status	Count
reduced margin (Grover), approved	2
Grover: acceptable to NIST, below ECCG/ANSSI guidance	32
n/a	1
vulnerable (Shor)	42

PQC readiness questionnaire

No readiness questionnaire was completed for this project.

Quantum algorithms relevant to this inventory

Quantum algorithm	Effect	Inventoried algorithms (rows)	What it means for this audit
Shor's algorithm — factoring Q1: quantum computation offline, classical access to the victim	breaks	RSA (2)	Breaks RSA at every key length: a longer modulus only raises the cost polynomially. Plan migration to ML-KEM (or a hybrid) for key establishment and ML-DSA / SLH-DSA for signatures; start with keys protecting data that must stay confidential for years (harvest now, decrypt later) and with long-lived signatures.
Shor's algorithm — discrete logarithms in finite fields Q1: quantum computation offline, classical access to the victim	breaks	BLS12-381 (11), BN254 (alt_bn128) (1)	Breaks finite-field Diffie–Hellman and DSA at every size. Move key establishment to ML-KEM (hybrid with X25519 or ECDH during the transition) and signatures to ML-DSA or SLH-DSA.
Shor's algorithm — elliptic-curve discrete logarithms Q1: quantum computation offline, classical access to the victim	breaks	BLS12-381 (11), BN254 (alt_bn128) (1), ECDH (5), ECDSA (23)	Elliptic-curve keys are expected to fall before RSA keys of comparable classical strength. On blockchains, coins whose public key is already on chain (reused addresses, pay-to-public-key and Taproot outputs) are exposed first; plan the move to post-quantum signatures and avoid key reuse in the meantime.

Grover's algorithm — key search and preimages Q1: quantum computation offline, classical access to the victim	weakens (larger keys restore the margin)	HMAC (1), Keccak-256 (29), SHA-2 (3), bcrypt (1)	Not a break. 256-bit keys (AES-256, ChaCha20) keep a comfortable margin; AES-128 meets NIST category 1, while some authorities ask for 256-bit keys in quantum-resistant contexts (see the AES-128 entry). Prefer 256-bit keys for long-lived data; 256-bit hashes need no change for preimage resistance.
Brassard–Høyer–Tapp — collision search Q1: quantum computation offline, classical access to the victim	weakens (larger keys restore the margin)	Keccak-256 (29), SHA-2 (3)	256-bit hashes (SHA-256, SHA3-256) remain adequate for collision resistance; 160-bit hashes are already weak classically (SHA-1 collisions are practical). Use 384/512-bit hashes where NIST categories 4–5 are required.

Effects: breaks — replace the algorithm; weakens — larger keys or outputs restore the margin; included in standard parameters — no action at standard parameter sets; only with superposition queries — not applicable to ordinary deployments.

Limitations and assumptions

- This report presents automated and documented analysis results for the stated scope. It is not a legal opinion, a certification or an attestation of compliance with any standard.
- z is a planning assumption chosen per risk profile, not a prediction. A cryptographically relevant quantum computer is not publicly known to exist today.
- keys — error (not checked): ethereum/api/src/main/java/org/hyperledger/besu/ethereum/api/jsonrpc/authentication/JWTAuthOptionsFactory.java line 118: public key could not be parsed (ValueError)

Remediation plan

QSI-2026-19546 · P3 · 90 days short-term risk reduction

Add ECDH usages at source code to the cryptographic inventory with an owner and a data-lifetime estimate; design for crypto-agility (algorithm identifiers, configurable providers).

Rationale	Migration cannot be planned without knowing where and why the algorithm is used.
Expected outcome	Every usage has an owner, a lifetime and a migration path.
Complexity	medium
Dependencies	Access to system owners.
Side effects	None (documentation and design work).
Tests before change	Confirm the inventory entry matches the deployed configuration.
Tests after change	Inventory review signed off by the system owner.
Closure criteria	Inventory entry with owner, lifetime and target algorithm exists.

QSI-2026-19543 · P3 · 90 days short-term risk reduction

QSI-2026-19546 · P4 · 90 days

root-cause fix

Plan migration of ECDH to Hybrid key establishment with ML-KEM (FIPS 203), e.g. X25519MLKEM768 in TLS 1.3 or mlkem768x25519-sha256 in SSH (or a hybrid scheme) once supported by your libraries, protocols and counterparties.

Rationale	Removes dependence on a quantum-vulnerable public-key primitive.
Expected outcome	The asset uses a NIST-standardized post-quantum or hybrid algorithm.
Complexity	high
Dependencies	Library/protocol support (e.g. OpenSSL ≥ 3.5, HSM firmware), interoperability with peers.
Side effects	Larger keys/signatures, possible performance and compatibility impact.
Tests before change	Interoperability tests in a staging environment.
Tests after change	Verify the negotiated/used algorithm on the production asset.
Closure criteria	Re-audit shows Hybrid key establishment with ML-KEM (FIPS 203), e.g. X25519MLKEM768 in TLS 1.3 or mlkem768x25519-sha256 in SSH or a hybrid scheme in use.
