Mosca's inequality (x + y > z): x = 10, y = 5, z = 8 → migration would finish too late under this scenario. z is a planning assumption chosen per risk profile, not a prediction. A cryptographically relevant quantum computer is not publicly known to exist today.

Post-quantum maturity: Level 1 of 4 — post-quantum code present, not wired. Next step: Wire the existing post-quantum primitive into a critical path (key wrapping or the channel) behind a hybrid construction, and test interoperability.

Supplied inputs

3388 files, 52428740 bytes in total, 2 redaction(s); the per-file SHA-256 list is in appendix C.

Methodology

The audit was performed by the QSI engine 1.3.0. Each analyzer emits facts (rule, parameters, evidence); finding texts are generated from the rule catalog. Methodology sources are listed under "Sources and normative documents".

Prioritization uses an explainable weighted model (severity, exploitability, exposure, confidentiality/integrity/availability impact weighted by the "Crypto exchange, custodian or wallet" profile, asset criticality, urgency, ease of remediation) with a confidence multiplier. CVSS v3.1 is applied only to technical vulnerabilities with a defined vector. Long-term quantum risks use Mosca's inequality; their severity is capped at Medium and they are never presented as exploitable vulnerabilities.

Finding classes: confirmed technical vulnerability; known vulnerable component (a dependency version named in an advisory; whether the affected code is reachable is assessed separately, and a component confirmed by review becomes a vulnerability); confirmed configuration error; potential cryptographic risk; long-term post-quantum risk; improvement recommendation; insufficient data. Heuristic findings are marked preliminary; analyst decisions are shown next to the findings.

Coverage of checks

Area	Status	Count	Examples
dependencies	checked	148	Cargo.lock: 288 dependencies parsed (288 pinned); Cargo.toml: 0 dependencies parsed (0 pinned); scripts/apply_load/token/Cargo.lock: 184 dependencies parsed (184 pinned)

Architecture overview

Static review of the source tree stellar-core at 362dbc5184c5fdc0d6e898f3046639dc5e2a4f32. 3388 files analysed; of 27064 files, 5182 are test, fuzzing, benchmark or example code and were left out, 16879 are not read by any analyzer, 0 exceed the per-file limit and 1615 did not fit the total limit. Files no analyzer reads include: .clang-format, .claude/skills/adding-a-new-skill/SKILL.md, .claude/skills/configuring-the-build/SKILL.md, .claude/skills/high-level-code-review/SKILL.md, .claude/skills/low-level-code-review/SKILL.md. Because the total limit bound, this inventory covers 3388 of 27064 candidate files (12%) and is a sample of the tree rather than a reading of it; a different limit gives a different figure. Files it could not fit include: lib/tracy/server/TracyMicroArchitecture.cpp, src/rust/soroban/p24/soroban-env-host/src/host/metered_vector.rs, src/rust/soroban/p24/soroban-env-host/src/host/prng.rs, src/rust/soroban/p24/soroban-env-host/src/host/trace.rs, src/rust/soroban/p24/soroban-env-host/src/host/trace/fmt.rs. 765 files in build-output or dependency-cache directories (.git, .hg, .venv, __pycache__, build, dist, node_modules, target, vendor, venv) were not read. 2628 files come from directories a .gitmodules pins and are read as shipped source rather than skipped as a dependency cache: lib/asio (596), lib/tracy (344), lib/gperftools (240), lib/libsodium (240). No requests were sent to the owner's systems.

Detailed findings

QSI-2026-19575 · CODE-HARDCODED-SECRET

High

Possible hard-coded secret in lib/sqlite/sqlite3.c

Confirmed configuration error | Confidence: Medium | preliminary — requires further verification

1 secret-like value(s) of type generic_assignment (first at line 106875). Values were redacted by QSI.

Affected asset	file:lib/sqlite/sqlite3.c
Data source	lib/sqlite/sqlite3.c
Detection method	Regular-expression matching of language-specific API patterns.
Analyzer	source_code 1.3.0 · 2026-11-06 16:13 UTC
Priority score	47.1 / 100 (Crypto exchange, custodian or wallet)
CVSS v3.1	not applicable

POTENTIAL IMPACT

Credentials in source code leak through repositories, builds and logs.

REPRODUCTION STEPS

```
Open line 106875 in the supplied file lib/sqlite/sqlite3.c and inspect the quoted lines (see evidence).
```

EVIDENCE

LIMITATIONS OF THE CHECK

Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

RECOMMENDATION

Move secrets to a secrets manager/environment; rotate the exposed values.

RETEST PROCEDURE

Re-scan the source and review the call sites listed in the evidence.

POTENTIAL IMPACT

Mnemonics, seeds or private keys drawn from such a generator can be enumerated from its small internal state: Milk Sad (CVE-2023-39910, mt19937 behind 'bx seed') and Trust Wallet (CVE-2023-31290) lost funds this way.

LIMITATIONS OF THE CHECK

Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

RECOMMENDATION

Use the platform CSPRNG (secrets, os.urandom, crypto.getRandomValues, crypto/rand, SecureRandom, OsRng) or a hardware TRNG for every key, seed and mnemonic.

stellar-xdr 21.2.0 is affected by GHSA-x57h-xx53-v53w (CVE-2026-29795)

Known vulnerable component | Confidence: Medium

OSV.dev reports GHSA-x57h-xx53-v53w (CVE-2026-29795) for crates.io package stellar-xdr at version 21.2.0: stellar-xdr's StringM::from_str bypasses max length validation. The advisory names no affected functions, so reachability was not determined.

LIMITATIONS OF THE CHECK

Advisory data comes from OSV.dev at the recorded time. Reachability is judged from names, not a call graph: the affected functions the advisory lists against the identifiers in the audited product code, a Cargo feature it says is off by default against the audited manifests, the platforms it lists against the declared Rust targets. Indirect calls (traits, macros, other dependencies) are not followed.

RECOMMENDATION

Upgrade to a fixed version (25.0.1).

RETEST PROCEDURE

Re-run the dependency scan after upgrading.

Quantum-vulnerable X25519: key wrapping and data encryption at rest (1 file(s))

Long-term post-quantum risk | Confidence: Medium | preliminary — requires further verification

1 reference(s) to X25519 across 1 file(s), e.g. lib/libsodium/src/libsodium/crypto_box/crypto_box_seal.c:32. Role, judged from paths, function names and nearby code: key wrapping and data encryption at rest. Keys or data encrypted to these public keys are stored: anyone who copies them now decrypts them once a CRQC exists (harvest now, decrypt later).

Affected asset	source-code:X25519:key_wrapping
Data source	lib/libsodium/src/libsodium/crypto_box/crypto_box_seal.c
Detection method	Regular-expression matching of crypto API patterns; the role comes from words in paths, enclosing function names and the lines around the matches.
Analyzer	source_code 1.3.0 · 2026-11-06 16:13 UTC
Priority score	36.9 / 100 (Crypto exchange, custodian or wallet)
CVSS v3.1	not applicable
Mosca's inequality (x + y > z)	x=10.0, y=5.0, z=8.0 → migration would finish too late under this scenario

POTENTIAL IMPACT

Long-term risk depends on what the algorithm protects: signatures (authenticity until migration) or key exchange/encryption (retroactive decryption of recorded data).

REPRODUCTION STEPS

LIMITATIONS OF THE CHECK

This is a forward-looking risk that depends on the arrival of a cryptographically relevant quantum computer (CRQC). No such computer is publicly known to exist today; the timeline is uncertain. It is not a present-day exploitable vulnerability. Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

Role, judged from paths, function names and nearby code: transaction and message signing. A CRQC derives the private key from a public key that is already known (on chain after the first spend, in reused addresses): funds and approvals controlled by these keys need a migration path.

Affected asset	source-code:ECDSA:transaction_signing
Data source	src/rust/soroban/p21/soroban-env-host/src/cost_runner/cost_types/recover_ecdsa_secp256k1_key.rs
Detection method	Regular-expression matching of crypto API patterns; the role comes from words in paths, enclosing function names and the lines around the matches.
Analyzer	source_code 1.3.0 · 2026-11-06 16:13 UTC
Priority score	35.6 / 100 (Crypto exchange, custodian or wallet)
CVSS v3.1	not applicable
Mosca's inequality (x + y > z)	x=10.0, y=5.0, z=8.0 → migration would finish too late under this scenario

POTENTIAL IMPACT

Long-term risk depends on what the algorithm protects: signatures (authenticity until migration) or key exchange/encryption (retroactive decryption of recorded data).

LIMITATIONS OF THE CHECK

This is a forward-looking risk that depends on the arrival of a cryptographically relevant quantum computer (CRQC). No such computer is publicly known to exist today; the timeline is uncertain. It is not a present-day exploitable vulnerability. Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

RECOMMENDATION

Follow each chain's post-quantum roadmap, avoid public-key reuse, and keep signers ready to add post-quantum signature schemes as chains adopt them.

RETEST PROCEDURE

Re-run the inventory after refactoring.

LIMITATIONS OF THE CHECK

This is a forward-looking risk that depends on the arrival of a cryptographically relevant quantum computer (CRQC). No such computer is publicly known to exist today; the timeline is uncertain. It is not a present-day exploitable vulnerability. Heuristic pattern match on source text without data-flow analysis. The usage context (security-relevant or not) must be confirmed manually; treat as preliminary.

RECOMMENDATION

Classify each usage, record data lifetimes, and plan migration to ML-DSA (FIPS 204) or SLH-DSA (FIPS 205), in a hybrid/composite form where the ecosystem supports it; introduce an abstraction layer for crypto-agility.

RETEST PROCEDURE

Re-run the inventory after refactoring.

Quantum-vulnerable Ed25519: authentication and identity (certificates, tokens, device attestation) (3 file(s))

Long-term post-quantum risk | Confidence: Medium | preliminary — requires further verification

3 reference(s) to Ed25519 across 3 file(s), e.g. src/rust/soroban/p21/soroban-test-wasms/wasm-workspace/simple_account/src/lib.rs:33. Role, judged from paths, function names and nearby code: authentication and identity (certificates, tokens, device attestation). Short-lived authentication stays safe until a CRQC exists; long-lived identities (device attestation, CA and SSH keys) need a plan earlier.

Affected asset	source-code:Ed25519:authentication
Data source	src/rust/soroban/p21/soroban-test-wasms/wasm-workspace/simple_account/src/lib.rs
Detection method	Regular-expression matching of crypto API patterns; the role comes from words in paths, enclosing function names and the lines around the matches.
Analyzer	source_code 1.3.0 · 2026-11-06 16:13 UTC
Priority score	34.2 / 100 (Crypto exchange, custodian or wallet)
CVSS v3.1	not applicable
Mosca's inequality (x + y > z)	x=10.0, y=5.0, z=8.0 → migration would finish too late under this scenario

POTENTIAL IMPACT

Long-term risk depends on what the algorithm protects: signatures (authenticity until migration) or key exchange/encryption (retroactive decryption of recorded data).

LIMITATIONS OF THE CHECK

Advisory data comes from OSV.dev at the recorded time. Reachability is judged from names, not a call graph: the affected functions the advisory lists against the identifiers in the audited product code, a Cargo feature it says is off by default against the audited manifests, the platforms it lists against the declared Rust targets. Indirect calls (traits, macros, other dependencies) are not followed.

LIMITATIONS OF THE CHECK

Advisory data comes from OSV.dev at the recorded time. Post-quantum assessment

	Key establishment (x = how long data must stay confidential; harvest now, decrypt later)	Signatures (x = how long signatures/ keys must stay trusted)
Data/key lifetime x	10	10
Migration time y	5	5
Assumed years to CRQC z	8 (early)	8
x + y − z	7 → migration would finish too late under this scenario	7 → migration would finish too late under this scenario

Planning assumptions: x for key establishment, x for signatures, y are the defaults of the risk profile “Crypto exchange, custodian or wallet”, not the client's figures; with the client's actual lifetimes the verdict can change.

Post-quantum maturity: Level 1 of 4 — post-quantum code present, not wired

- A post-quantum library is declared as a dependency
- Classical only — key wrapping and data encryption at rest: X25519 (1 file(s))

Next step: Wire the existing post-quantum primitive into a critical path (key wrapping or the channel) behind a hybrid construction, and test interoperability.

Levels: 0 none; 1 present, not wired; 2 in use outside the critical paths; 3 hybrid in a critical path; 4 post-quantum by default in the critical paths (root of trust, key wrapping, channel key exchange). Judged from code and manifests.

What the quantum-vulnerable algorithms do

Role	Algorithms (files)	ID	First step
key wrapping and data encryption at rest	X25519 (1)	QSI-2026-19581	Wrap keys with ML-KEM or a hybrid KEM (X25519 + ML-KEM-768) and re-wrap the stored keys; data that may already have been copied needs its own assessment
transaction and message signing	Ed25519 (12), ECDSA (8)	QSI-2026-19579, QSI-2026-19583	Follow each chain's post-quantum roadmap, avoid public-key reuse, and keep signers ready to add post-quantum signature schemes as chains adopt them
authentication and identity (certificates, tokens, device attestation)	Ed25519 (3)	QSI-2026-19585	Keep credentials short-lived and plan ML-DSA certificates, tokens and keys as the ecosystem supports them

role not determined	Ed25519 (44), ECDSA (24), BLS12-381 (12), X25519 (9)	QSI-2026-19577, QSI-2026-19578, QSI-2026-19584, QSI-2026-19586	Classify each usage, record data lifetimes, and plan migration to Hybrid key establishment with ML-KEM (FIPS 203), e.g. X25519MLKEM768 in TLS 1.3 or mlkem768x25519-sha256 in SSH; introduce an abstraction layer for crypto-agility

Roles are judged from file paths, function names and the code around each match; review confirms them. Root-of-trust keys and wrapped keys come first: they are hard to replace or can be recorded today.

z is a planning assumption chosen per risk profile, not a prediction. A cryptographically relevant quantum computer is not publicly known to exist today.

Quantum status	Count
weak classically	1
reduced margin (Grover), approved	111
Grover: acceptable to NIST, below ECCG/ANSSI guidance	62
n/a	68
post-quantum	1
vulnerable (Shor)	176

Quantum algorithms relevant to this inventory

Quantum algorithm	Effect	Inventoried algorithms (rows)	What it means for this audit
Shor's algorithm — discrete logarithms in finite fields Q1: quantum computation offline, classical access to the victim	breaks	BLS12-381 (18)	Breaks finite-field Diffie–Hellman and DSA at every size. Move key establishment to ML-KEM (hybrid with X25519 or ECDH during the transition) and signatures to ML-DSA or SLH-DSA.

Shor's algorithm — elliptic-curve discrete logarithms Q1: quantum computation offline, classical access to the victim	breaks	BLS12-381 (18), ECDSA (64), Ed25519 (76), X25519 (18)	Elliptic-curve keys are expected to fall before RSA keys of comparable classical strength. On blockchains, coins whose public key is already on chain (reused addresses, pay-to-public-key and Taproot outputs) are exposed first; plan the move to post-quantum signatures and avoid key reuse in the meantime.
Grover's algorithm — key search and preimages Q1: quantum computation offline, classical access to the victim	weakens (larger keys restore the margin)	AES-256 (2), Argon2 (17), BLAKE2 (28), ChaCha20-Poly1305 (21), HMAC (16), Keccak-256 (8), MD5 (1), PBKDF2 (2), Poly1305 (18), SHA-2 (29), XSalsa20-Poly1305 (29), scrypt (3)	Not a break. 256-bit keys (AES-256, ChaCha20) keep a comfortable margin; AES-128 meets NIST category 1, while some authorities ask for 256-bit keys in quantum-resistant contexts (see the AES-128 entry). Prefer 256-bit keys for long-lived data; 256-bit hashes need no change for preimage resistance.
Brassard–Høyer–Tapp — collision search Q1: quantum computation offline, classical access to the victim	weakens (larger keys restore the margin)	BLAKE2 (28), Keccak-256 (8), MD5 (1), SHA-2 (29)	256-bit hashes (SHA-256, SHA3-256) remain adequate for collision resistance; 160-bit hashes are already weak classically (SHA-1 collisions are practical). Use 384/512-bit hashes where NIST categories 4–5 are required.

Effects: breaks — replace the algorithm; weakens — larger keys or outputs restore the margin; included in standard parameters — no action at standard parameter sets; only with superposition queries — not applicable to ordinary deployments.

Limitations and assumptions

- This report presents automated and documented analysis results for the stated scope. It is not a legal opinion, a certification or an attestation of compliance with any standard.
- z is a planning assumption chosen per risk profile, not a prediction. A cryptographically relevant quantum computer is not publicly known to exist today.
- tls_key_exchange_groups — Insufficient data: lib/fmt/support/docopt.py line 80: not in the algorithm registry, not assessed: [[pattern]]
- osv_advisories — not checked: 14 package(s) are built from git repositories (forks or unreleased code), so registry advisories were not looked up for them: soroban-builtin-sdk-macros, soroban-env-common, soroban-env-host, soroban-env-macros, soroban-fuzz-targets, soroban-synth-wasm, soroban-test-wasms, soroban-wasmi, stellar-quorum-analyzer, stellar-strkey, stellar-xdr, wasmi_arena …

Remediation plan

root-cause fix

Rotate and remove secrets found in lib/sqlite/sqlite3.c.

Rationale	Eliminates the root cause described in the finding.
Expected outcome	The weakness is no longer present on re-test.
Complexity	low
Dependencies	Change window and owner approval.
Side effects	Possible compatibility impact on old clients.
Tests before change	Reproduce the finding using the documented steps.
Tests after change	Re-run the retest procedure from the finding.
Closure criteria	Secret scanner reports no secrets; old values revoked.

root-cause fix

Use the platform CSPRNG (secrets, os.urandom, crypto.getRandomValues, crypto/rand, SecureRandom, OsRng) or a hardware TRNG for every key, seed and mnemonic.

Rationale	Mnemonics, seeds or private keys drawn from such a generator can be enumerated from its small internal state: Milk Sad (CVE-2023-39910, mt19937 behind 'bx seed') and Trust Wallet (CVE-2023-31290) lost funds this way.
Expected outcome	Re-scan the source and review the call sites listed in the evidence.
Complexity	medium
Tests before change	Open line 59 in the supplied file src/crypto/SecretKey.h and inspect the quoted lines (see evidence).
Tests after change	Re-scan the source and review the call sites listed in the evidence.
Closure criteria	Re-scan the source and review the call sites listed in the evidence.
